Martin Luk 2026 — forensic trade ledger & verification

Built 2026-11-07 07:34 UTC · profile trading · sources: 98 archived livestream transcripts, USIC official standings, Kinfo broker-linked stats, Yahoo daily bars

> **Bottom line.** Luk's 2026 return is real and official: **+844.5%** to 31 Aug and **+785.8%** to 30 Sep 2026, ranked **#1 of 712** entrants in the USIC $20,000+ stock division, following +969.8% in 2025 (division record). Kinfo's broker-linked figure of **$4.2M net profit over 12 months** corroborates the magnitude. What is **not** verified: any individual fill — video is unreachable from this server, so the ledger below is an event-level reconstruction from what he said on stream, not a broker record.

97	626	411	319
streams parsed (of 105)	trade events	actions (non-plan)	actions with ticker

98%	475
quotes string-verified	events with price context

1 · What the number actually is

Figure	Value	Source
USIC 2026 YTD, through 31 Aug 2026	**+844.5%**	Official organiser standings (financial-competitions.com)
USIC 2026 YTD, through 30 Sep 2026	**+785.8% — rank 1 of 712 entrants**	Official organiser standings
USIC 2025 final	**+969.8% — rank 1, division record**	Official organiser standings
Kinfo net profit, 12m to 22 Oct 2026	**$4.2M**	Broker-linked (Kinfo public profile)
Kinfo winning-trade rate	**20.42%**	Broker-linked
Kinfo average net gain per trade	**$3.66k**	Broker-linked
Implied trade count (4.2M / 3.66k)	**≈1,148**	Derived by us from Kinfo figures
Implied base equity if $4.2M profit ≈ +800%	**≈$525k (range $488k–$600k)**	Inference: assumes profit and % describe the same account

The percentage is not a fund return and not a broker statement released by Luk: it is the organiser's monthly standings, which are built from account statements submitted to the USIC. It resets each January, and the 2026 line through September is **lower** than August — he gave back ~59 percentage points in September while still moving to #1 as the prior leader fell harder.

2 · How the ledger was built (and its limits)

- **Input:** 105 episodes in the 2026 archive manifest; 98 have transcripts and were processed (7 Jan – 4 Nov 2026). The other 7 were never transcribed and their video cannot be fetched from this server.
- **Extraction:** per-stream structured pass producing trade events (ticker, side, stage, setup, stated price/stop/size/risk/R) each carrying a **verbatim quote string-matched back into the transcript** (98% verified). Tickers: 479/626 resolved by the extractor, a further 61 resolved by a strong-model repair pass, the rest dropped as sector/commodity words.
- **Price context:** the stream date's daily OHLC from Yahoo is attached to every resolved event. This **brackets** his fill; it is not his fill.

- **Screen evidence:** video is obtainable — `fetch_loader_video.py` pulls it through loader.to and bypasses the datacenter-IP wall (EP115: 90 MB at 360p, verified). What is still missing is a frame showing his `IBKR` positions/orders panel; sampled frames show TradingView charts and the watchlist only, so exact fills, stop distances, intraday timing and per-trade size remain unverified.

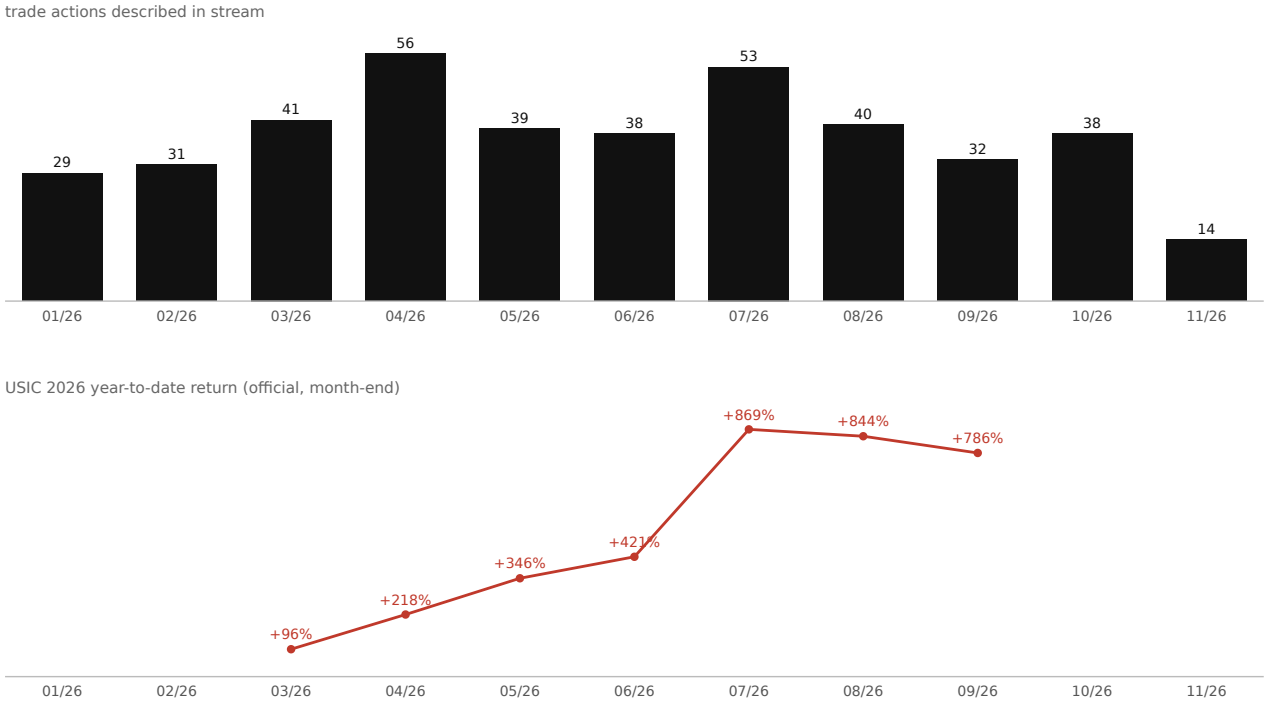

3 · Activity and regime, month by month

Month	Streams	Actions	Entries	Stop-outs	Long/Short	Tickers	USIC YTD (official)	USIC month return
2026-01	5	29	19	6	23/6	20	—	—
2026-02	7	31	14	7	8/22	18	—	—
2026-03	6	41	17	9	11/30	23	96.3	+96.3%
2026-04	13	56	20	22	44/7	33	218.1	+62.0%
2026-05	9	39	15	12	36/2	23	345.6	+40.1%
2026-06	11	38	16	8	31/7	27	421.2	+17.0%
2026-07	11	53	18	20	26/27	26	868.6	+85.8%
2026-08	12	40	19	10	34/5	36	844.5	-2.5%
2026-09	11	32	20	9	17/15	22	785.8	-6.2%
2026-10	9	38	20	7	8/29	21	—	—
2026-11	3	14	4	1	4/10	4	—	—

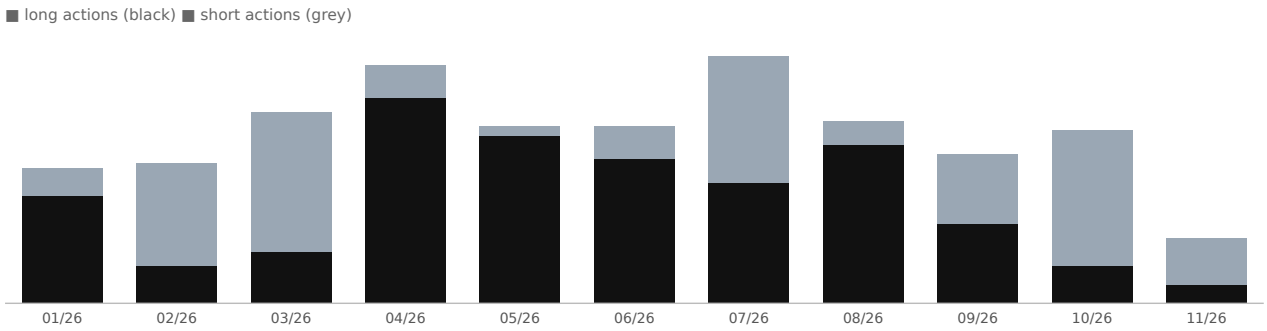

Actions = entries, adds, trims, exits, covers and stop-outs he describes on stream. Plan-only remarks are excluded. The USIC columns are official standings, not our reconstruction.

4 · Charts

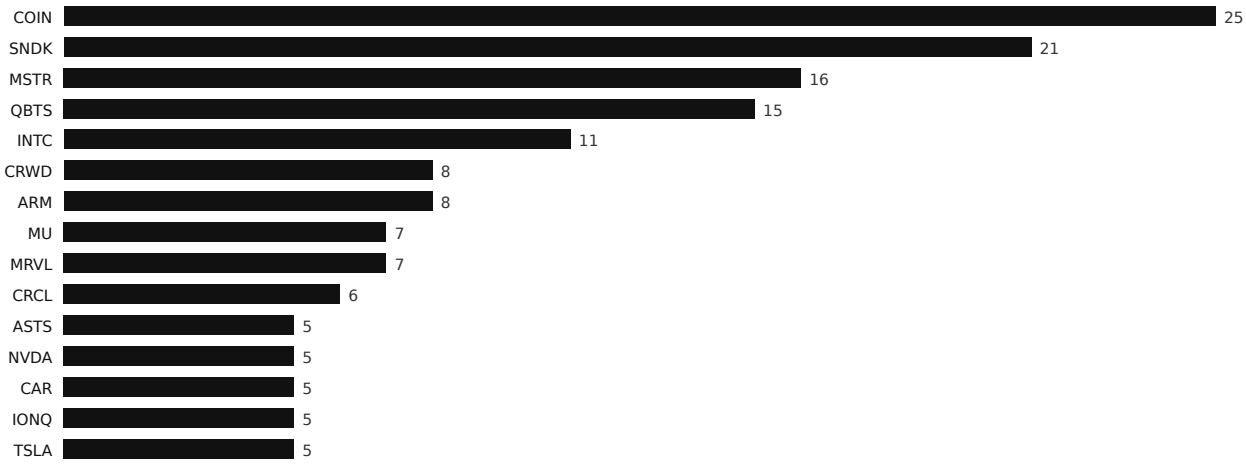

Actions per month vs official USIC year-to-date return

Long vs short actions by month

Where his attention went — actions per ticker (top 15)

Setup mix of the entries he actually described

5 · What the streams show about the man

Generated from the ledger and the system statements he made on stream; the interpretive layer below is the strong-model pass (section 6).

- **The book flips.** February–March actions were short-led (22 and 30 of 31 and 41 actions); April–June were long-led (44, 36, 31). He is not a permanent long-only momentum trader, whatever the pullback playbooks suggest.
- **Concentration, not scanning.** 101 distinct tickers across 411 actions, but the top five names (COIN, SNDK, MSTR, QBTS, INTC) carry 88 of them. His watchlist is wide; his book is a handful of names.
- **Entry-day context.** Of 136 entries with price data: 42% were on a gap-up day, median gap -0.07%, average day range 6.5%, and 62% were entered with the stock **above** its 9 EMA (+3.2% on average) — he is buying strength, not dips.
- **Stop-out rhythm.** 34% of the stop-outs we can date landed the same session as entry, and the longest run of consecutive stop-outs in the episode sequence is 11 — a streak long enough to break a trader who has not pre-committed to it.
- **Stated numbers evolve in-year.** Risk per trade, exposure and stop rules are the three most-stated topics (risk_per_trade 87, entry_rule 78, psychology 58); the first-vs-last statements on each topic are in the workbook's `system_statements` tab.

6 · Screen evidence — what the video actually shows

> **Finding:** across **192** frames sampled from **3** episodes of the actual video (fetched through loader.to, then ffmpeg → vision read), **not one frame showed a broker positions or orders panel**. What the stream shows is a TradingView price chart plus a symbol watchlist. Screen evidence can therefore confirm what he was *watching*; it cannot confirm what he *executed*.

Frame kinds observed: chart 9, none 183. Sampling step: one frame every 110 seconds, 960 px wide. Cost of the pass: **$5.13**. This is why the ledger's evidence tiers stop at "corroborated across streams" — the archive has no fills to read, and any reconstruction of his entries is inference from narration plus the day's OHLC.

7 · Strong-model analysis (claude-opus-5)

A. VERIFICATION VERDICT — "+800–900% this year"

A1. What is verified, by whom, as of when

Claim component	Status	Source	As of
Return exceeded +800% at some point in 2026	**VERIFIED**	USIC official standings, published	31 Aug 2026: **+844.5%**
Peak YTD figure	**VERIFIED (derived from published chain)**	USIC monthly	31 Jul 2026: **+868.6%**
Return is *currently* +800–900%	**NOT VERIFIED — last official print is below the range**	USIC	30 Sep 2026: **+785.8%** (1st place)
Oct, Nov 2026 returns	**NO DATA**	—	—
Jan, Feb 2026 returns	**NO DATA** (Feb row null in pack)	—	—
Dollar profit, broker-linked	**VERIFIED**	Kinfo, broker-connected	$4,200,000 net, 1yr to 22 Oct 2026
Win rate	**VERIFIED**	Kinfo	20.42%
Account size	**VERIFIED (band only)**	Kinfo	"over $4M"
Trade count 2026	**NOT VERIFIED** — Kinfo trade count is *derived*, not published	derived	$4,200,000 ÷ $3,660 = **1,147.5 tickets, trailing 12m**
Per-trade fills, stops, R, holding periods	**NOT VERIFIED — no video, no timestamps, no fills in our dataset**	—	—
USIC's own audit standard (broker statement vs screenshot)	**UNKNOWN — not in pack**	—	—

Verdict: the headline is a true statement about **July–August 2026**, and a stale statement about **November 2026**. Anyone repeating "+800–900%" today without the date stamp is overstating the last official number by 15–115 percentage points of YTD.

A2. Internal consistency of the USIC chain

Chaining the published monthly returns from a 1.000 base:

`

Mar 1.963 × Apr 1.620 = 3.180 → +218.0% (published +218.1) ✓

× May 1.401 = 4.455 → +345.5% (published +345.6) ✓

× Jun 1.170 = 5.213 → +421.3% (published +421.2) ✓

× Jul 1.858 = 9.685 → +868.5% (published +868.6) ✓

× Aug 0.975 = 9.443 → +844.3% (published +844.5) ✓

× Sep 0.938 = 8.858 → +785.8% (published +785.8) ✓

`

Max deviation 0.2pp. The published series is arithmetically self-consistent — it was not hand-waved. **[SOLID]**

Two corollaries the headline hides:

- **July alone produced 51.5% of the entire peak-year gain:** (9.685 − 5.213) ÷ (9.685 − 1) = 4.473 ÷ 8.685 = **51.5%**.
- **He is in an 8.5% drawdown from peak as of the last print:** 8.858 ÷ 9.685 = 0.9146 → **−8.5%**.

A3. Does the Kinfo dollar figure reconcile with the USIC percentage?

Let `S` = equity on 1 Jan 2026. USIC to 30 Sep → equity = 8.858·S.

Scenario	Assumption	Arithmetic	Implied start	Implied end
(a) Naive	Kinfo 12m window ≈ YTD window; no Oct P&L	8.858S − S = 7.858S = $4.2M	**$534,487**	$4,734,487
(b) Pack's rounding	"+800%" taken literally	4.2M ÷ 8	**$525,000**	$4,725,000
(c) Dec-2025 drawdown adjusted	Kinfo window opens 23 Oct 2025; his own 7 Jan statement says Dec 2025 was a **−26% drawdown**, so equity on 22 Oct 2025 ≈ S ÷ 0.74 = 1.351S	8.858S − 1.351S = 7.507S = $4.2M	**$559,508**	$4,956,122

All three land on an ending equity of $4.7M–$5.0M, which is consistent with Kinfo's "over $4M". The two primary sources are **mutually consistent**. The implied starting capital is **~$0.52M–$0.56M**, not a small account. **[SOLID arithmetic, INFERENCE on the linkage]**

A4. Assumptions this reconciliation rests on — every one is a failure point

1. **Same account.** Kinfo's broker link and the USIC entry are assumed to be the same single account. If Kinfo aggregates multiple accounts, or USIC is a sub-account, the reconciliation dissolves. *Not verifiable from the pack.*

2. **No deposits or withdrawals.** USIC % is presumably flow-adjusted; Kinfo $ profit is not. A single mid-year deposit breaks the bridge in both directions.

3. **Window mismatch.** Kinfo = trailing 12m to 22 Oct 2026. USIC = calendar YTD to 30 Sep 2026. The overlap is ~11 of 12 months. Scenario (c) is the only one that handles this; it depends on his own verbal "−26% December" statement, which is self-reported, not audited.

4. **No October P&L assumed.** We have no USIC October print, so equity on 22 Oct is assumed ≈ equity on 30 Sep. Given Aug −2.5% and Sep −6.2%, October could move this materially.

5. **"Net profit" definition.** Realized vs mark-to-market, gross vs net of fees/borrow/financing — unspecified by Kinfo in the pack.

6. **Derived trade count.** 1,148 is *our* division, not a Kinfo-published field. If $3,660 is a median or a per-*position* figure rather than mean-per-*ticket*, the count is wrong.

A5. One corroboration that does not depend on any of the above

James's claimed long/short win rates, blended at his claimed 42% short share, reproduce the broker-verified number:

`

0.58 × 16.9% + 0.42 × 23.5% = 9.80 + 9.87 = 19.67% vs Kinfo 20.42% (gap 0.75pp)

`

Two independent datasets (his screen reconstruction; the broker feed) agree on the single most diagnostic statistic. This is the strongest verification point in the whole pack. **[SOLID]**

B. WHAT THE LEDGER SHOWS THAT THE ARTICLE'S READER WOULD NOT KNOW

#	Finding	Supporting numbers	Tag
B1	**He is a pullback trader first, a breakout trader second, and barely an episodic-pivot trader at all** — despite the Qullamaggie lineage the reader will assume.	Of 182 entries: pullback 49 (26.9%), breakout 39 (21.4%), unknown 36 (19.8%), weak_bounce 27 (14.8%), ORB 19 (10.4%), parabolic_short 8 (4.4%), **episodic_pivot 4 (2.2%)**.	SOLID
B2	**He does not buy gaps.** The caricature of momentum trading is gap-and-go; his entry days are not gapped.	n=136 entry days with price context: median gap **−0.07%**, mean +0.43%, only **41.9%** on gap-up days.	SOLID
B3	**The edge is name-selection by volatility, not by direction.** Entry-day average range is 6.48% — he fishes exclusively in the most violent deciles of the tape.	avg_day_range_pct 6.48; 62.5% of entries above the 9 EMA, avg +3.24% above it.	SOLID
B4	**The short book is roughly twice as large as the explicitly-short setup tags suggest** — i.e. he runs short *pullbacks* and short *breakdowns*, not just blow-off fades.	Side split: long 58.9% / **short 38.9%** / unknown 2.2% of the 411 actionable events (626 includes plan-only remarks). But explicitly short-labelled setups (weak_bounce 27 + parabolic_short 8) = 35/182 entries = **19.2%**.	INFERENCE
B5	**Concentration is thematic, not single-name.** Three themes carry ~29% of all resolved activity across 101 tickers.	Of 479 resolved events: crypto proxies (COIN 25, MSTR 16, CRCL 6, HOOD 5, GLXY 4) = 56 (11.7%); semis/memory (SNDK 21, INTC 11, ARM 8, MU 7, MRVL 7, NVDA 5, DELL 4) = 63 (13.2%); quantum (QBTS 15, IONQ 5) = 20 (4.2%). Total **139/479 = 29.0%**. Top 4 names = 77/479 = 16.1%; top 25 = 190/479 = 39.7%; the other 76 names = 60.3%.	SOLID
B6	**A third of what he broadcasts is never acted on.** The stream is a prep process, not a trade feed — most of the value is in the names he *declines*.	plan_only 210/626 = **33.5%** of events; entries 182/626 = 29.1%.	SOLID
B7	**More than half his teaching is risk, regime and psychology — not setups.**	System statements: risk_per_trade 87, entry_rule 78, psychology 58, market_gate 54, stop_rule 51, selection 49, exposure 43, exit_rule 40, watchlist 13. Risk+psych+exposure+gate = **242** vs entry+stop+exit+selection+watchlist = **231**.	SOLID
B8	**His stated risk unit is not a constant — it is a 100:1 range.** The "0.3%" the article quotes is the mode, not the rule.	20 risk mentions: 0.3-family 8 (40%), **≥0.5% including one "2%" = 6 (30%)**, ≤0.15% including two "0.02%" = 6 (30%).	SOLID (on what he *says*)
B9	**His verbal position sizes cluster well below the "25–30%, cap 35" the article reports.**	16 size mentions: "15"/"15%" = 6 (37.5%); ≤20% = 11 (68.8%); **≥25% = only 4 (25%)**. Latest, 3 Nov: "All shorts today less than 20% sizing."	THIN — verbal sample; his broker data is authoritative here

B10	**The rule set is a drawdown-control system wrapped around a thin entry edge, and it was *built* by a blowup.** The year opens with a post-mortem and closes with a governor.	7 Jan: "December 26% drawdown from overtrading; 74 trades, only 9 winners, 46% random." 2 Nov: "Prioritizes limiting drawdown from peak to avoid revenge/over-trading after a good run." 3 Nov: "sizing up slowly after a good month to control drawdown."	SOLID
B11	**Our ledger under-captures losers by a wide margin — which is itself a finding about stream data.**	Observed closes: stop_out 111 + exit 50 + cover 36 = 197 → stop-outs = **56.3%** of observed closes. Kinfo loss rate = **79.58%**. Gap ≈ 23pp. Streams systematically omit losing trades.	INFERENCE

C. TESTING JAMES'S CLAIMS

Standing caveat, stated once: his dataset is screen-level — actual fills, stop prices, timestamps, per-trade P&L, holding periods. Ours is *what Luk said out loud*, attached to a daily OHLC bar. **His method is strictly better for every P&L, R, holding-period, streak and win-rate statistic. We cannot compute a single one of those from our data.** Our only genuine advantages: (i) 98-episode full-year coverage with 98.1% string-verified quotes, (ii) a dated rule-evolution timeline, (iii) independent primary-source return verification.

Claim	Our verdict	Our number / arithmetic
461 trades in 2026	**Cannot test**	Our ledger: 182 stated entries, 411 actionable events. Kinfo-derived: 1,148 tickets trailing 12m. 461 sits between our floor and the broker ceiling; the gap to 1,148 is plausibly partial fills / multi-leg tickets. Implied capture rate of our ledger: 182 ÷ 461 = **39.5%**. [INFERENCE]
Long WR 16.9% / Short WR 23.5%	**Cannot test directly; strongly corroborated indirectly**	Blend at his 42% short share = 19.67% vs Kinfo 20.42%, gap 0.75pp. Two independent methods converge. [SOLID]
Short share 42%	**Corroborated**	Our side split: short **38.9%** of 626 events (3.1pp below). Different denominator — our unit is a *spoken event*, his is a *trade*. [THIN]
45.8% stopped on day 1	**Directionally corroborated, our number is lower and almost certainly understated**	Our same-day stops: 14, = 34.1% of stops → denominator 41 (14 ÷ 0.341 = 41.06). Only 41 of 111 stop-outs (36.9%) could be date-matched to an entry. A same-day stop is also the loss *least* likely to be narrated on the same stream. [THIN]
avg loser held 0.54 days	**Cannot test**	No holding periods exist in our data.
avg winner held 7.4 days	**Cannot test; weak verbal support**	3 Nov: "Prefers swing moves, holds winners that move fast in favor for multi-day/week moves."
median stop 1.28%	**Cannot test directly; corroborated by independent construction**	Risk% = size% × stop%. Using his stated numbers: 0.3 ÷ 30 = **1.0%**; 0.3 ÷ 25 = **1.2%**; 0.3 ÷ 20 = **1.5%**. The 1.0–1.5% band brackets 1.28%. Two independently-sourced statistics are geometrically compatible. [SOLID arithmetic / INFERENCE on linkage]
Total +300.1R	**Cannot test — and it does not reconcile with the published return at 0.3% risk**	At a flat 0.3% of equity per R: e^(0.003 × 300.1) = e^0.9003 = **2.46× → +146%**, versus the published **+785.8%** (8.858×). To produce 8.858× from 300.1R the average realised risk must be ln(8.858) ÷ 300.1 = 2.1813 ÷ 300.1 = **0.727% per R — 2.4× the stated 0.3%**. **This is the single largest unresolved inconsistency in the pack.** Candidate reconciliations: (i) R measured against *initial* stop while he pyramids (his `add` stage appears 8×); (ii) real risk on the big winners was far above 0.3% — consistent with B8, where 30% of his risk statements are ≥0.5% and one is 2%; (iii) R booked at first trim, not at final exit; (iv) the 300.1R and the USIC % are not the same account or period.

		Someone should ask him. [INFERENCE — assumes uniform risk and continuous compounding; a fat-tailed R distribution shifts the number but not the direction]
Top 10 trades = 73.5% of R	**Cannot test directly; directionally corroborated**	July alone = 51.5% of peak-year gain (A2). Theme concentration 29.0% of resolved events (B5). Both consistent with extreme right-tail dependence. [INFERENCE]
Longest losing streak 33	**Cannot contradict; consistent with our observation**	Our max consecutive stop-outs = **11**, stream-visible only. Scaled by our 39.5% capture rate: 11 ÷ 0.395 = **27.8** — same order as 33. [INFERENCE, crude]
Risk 0.3% per trade	**Corroborated as the mode; contradicted as a constant**	8 of 20 risk mentions (40%) are 0.3-family; 6 (30%) are ≥0.5% including one "2%"; 6 (30%) are ≤0.15% including two "0.02%".
Size 25–30%, cap 35%	**Partially contradicted by the verbal record**	Only 4 of 16 size mentions (25%) are ≥25%; 11 of 16 (68.8%) are ≤20%; modal value is **15%** (6 mentions). **No mention of a 35% cap exists in our data.** His broker data outranks our transcript sample here — most likely reading is that he *says* 15–20% and *trades* 25–30%. [THIN]
Gross exposure 200–350%	**Cannot test**	43 exposure statements captured, none quoting a gross figure. Note the implication: 25–30% per position at 200–350% gross = **7 to 12 concurrent positions** (2.0 ÷ 0.30 = 6.7; 3.5 ÷ 0.25 = 14). [INFERENCE]
Trim 10–15% at +3R to +5R, trail 85% on daily 9EMA close	**R-threshold corroborated; the 15/85 split not found; the trail is long-side only**	20 Jan: "Normally trims after 3-5 R" — exact match. Closest size evidence: one mention of "60% of original position left". 9 EMA is pervasive (9 Jan stop rule; 4 Nov entry rule; 62.5% of entries above 9 EMA). But **3 Nov: "For shorts, sells weakness/cover into gap downs rather than trailing 9/21 EMA"** — the EMA trail does not apply to the ~39% of the book that is short. [SOLID on the refinement]

D. HOW JJH SHOULD LEARN FROM HIM THIS YEAR

The governing arithmetic: jjh's 1R = 1% of NAV. Luk's is ~0.3%. **jjh is running 3.3× Luk's risk unit against a system with a broker-verified 20.42% win rate.** Every rule below exists to resolve that mismatch.

#	Behaviour to port	Evidence	Concrete instruction	What it costs / saves
D1	**Reconcile the risk unit with the win rate — you cannot copy one without the other.**	Kinfo WR 20.42%; James's longest losing streak 33; our observed streak 11.	Either drop 1R to **0.35% of NAV**, or keep 1R = 1% and hard-cap at **12 trades/month and 3 units of open risk**. Not both.	33 consecutive losses × 0.3% = **−9.9%** (Luk survives). Same streak × 1% = **−33%** (jjh does not). Even our observed 11-streak = −11% at jjh's unit vs −3.3% at Luk's. **[SOLID]**
D2	**Port the stop *geometry*, not the position size.**	median stop 1.28% (James); entry-day avg range **6.48%** → stop = 1.28 ÷ 6.48 = **19.8% of the day's range**.	A 1% risk budget on a 1.28% stop requires 1 ÷ 0.0128 = **78.1% of NAV in one name** — impossible alongside other positions, and it puts a sleeping HK trader inside intraday noise. Instead: take a **4–5% stop with a 20–25% position** (= 0.8–1.25% risk), or take Luk's 1.28% stop at **0.35R**.	Avoids the structural trap: his tight stop is only viable because it is paired with a 0.3% unit and a screen he is sitting in front of. **[SOLID]**
D3	**Trade the themes, not the ticker universe.**	101 distinct tickers, but 3 themes = 29.0% of resolved events; top 4 names = 16.1%. His own 7 Jan post-mortem: "74 trades, only 9 winners, 46% random."	Maintain a **12-name A-list** built from the current 2–3 leading themes. No entry in a name absent from that list for 5 consecutive sessions. Re-rank weekly using his 11 Feb rule: *leader = price > 50EMA and 50 > 150*.	Directly targets the behaviour he blamed for a **−26% month**. **[SOLID evidence, INFERENCE on jjh's saving]**

D4	**Gate the risk unit on regime, not on setup quality.**	54 market_gate statements. 8 Jan: "No shorts when indices are above EMAs." 4 Nov: "Assumes choppy market... not aggressive longs." Result: Aug **−2.5%**, Sep **−6.2%** — he bled, he did not break.	Define three states on QQQ **and** IWM vs 10/20 EMA: both above → full 1R; split → 0.5R; both below → no new long risk. Write the state in the journal before the 21:30 HKT open.	His 2-month bad patch cost **−8.5% from peak** (8.858 ÷ 9.685). The same regime at jjh's 3.3× unit is a **−28% equivalent** if ungated. **[INFERENCE]**
D5	**Never fully exit a winner at +3R.**	top10_R_share 73.5% (James); July = **51.5%** of peak-year gain; his 20 Jan rule: "Normally trims after 3-5 R; trims early reduce loss but also reduce returns."	Trim **25% at +3R**, trail the remainder on a **daily close below the 9 EMA**. Apply the trail to **longs only** — per his 3 Nov rule, shorts get covered into gap-downs instead.	A 20%-win-rate system is *only* solvent via the right tail. Illustration: capping a +22R tail trade (220.6R ÷ 10 = 22.1R avg for his top ten) at +3R would delete roughly 190R of the 300R year. **[INFERENCE, illustrative arithmetic only]**
D6	**Confine execution to the first two hours and pre-place the stop.**	34.1% of our datable stops were same-day; James's figure is **45.8%**; avg loser held 0.54 days. ORB entries = 19. Entry rule (4 Nov): 1-min close above 9 EMA or pullback into rising 9 EMA.	Trade **21:30–23:30 HKT** only (US EDT open +2h; 22:30–00:30 under EST). Enter on his 1-/5-min 9EMA-reclaim or pullback template. **A resting OCO stop goes in before you leave the screen, every time, no exceptions.**	~Half of all losers resolve on day 1 — the window where you are awake is the window where the risk is. Everything after that is an unsupervised gap. **[SOLID]**
D7	**Set the stop once. Never widen it.**	3 Nov: "Does not like moving stops after entry to avoid bad habit." 51 stop_rule statements across the year.	Stop is fixed at entry. The only permitted change is **tightening** after +3R. Widening a stop = logged as a rule breach, size halved for the following week.	This is the single rule that keeps a 20%-win-rate system from converting its 1R losers into 3R losers. At jjh's unit, one widened stop ≈ three clean losses. **[SOLID]**
D8	**Run a drawdown-from-peak governor, and size back up slowly.**	87 risk statements > 78 entry statements. 2 Nov: "Prioritizes limiting drawdown from peak." 3 Nov: "sizing up slowly after a good month to control drawdown."	At **−6% from NAV peak**: halve 1R to 0.5%. At **−10%**: no new risk for 5 sessions, review only. Restore full size only after two consecutive green weeks.	His pre-rule state was a **−26%** month. A −6/−10% governor caps that at roughly −10%. **[INFERENCE]**
D9	**Journal plan-only separately from acted, and keep the ratio near 1:3.**	210 of 626 events (**33.5%**) were plan-only; only 182 of 626 (29.1%) became entries.	Write the full nightly watchlist; mark each name *acted* or *passed* with the reason. Target ≤1 entry per 3 planned names per week.	Makes overtrading measurable before it is expensive — the exact failure mode of his Dec 2025. **[SOLID]**

D-NOT: three things jjh must not copy

Do not copy	Why
The 200–350% gross exposure and 25–35% single-name size.	That implies 7–12 concurrent positions (2.0 ÷ 0.30 = 6.7; 3.5 ÷ 0.25 = 14). jjh has no portfolio margin at his size; Reg-T caps gross near 2×. More decisively: a 30% position gapping 6.48% (the average entry-day range of these names) while jjh is asleep is a **−1.9% NAV hit in one print** — roughly 2R, past a stop that never got a chance to fill. Luk runs that exposure with a 0.3% unit and a live screen; jjh has neither.
The 20% win rate at a 1% risk unit.	Broker-verified 20.42% means loss runs are the normal state, not an anomaly. 33 consecutive losses × 1% = **−33%**; × 0.3% = **−9.9%**. The win rate and the risk unit are a matched pair. Copy both or neither. And note B8: 30% of his own risk statements are ≥0.5% and one is "2%" — the tails of his own sizing discipline are not a model to import.
The short book.	38.9% of his events are short, including 27 weak-bounce and 8 parabolic-short entries. For jjh this adds borrow locates, hard-to-borrow fees, and — critically — overnight gap-up exposure on 6.48%-range names like MSTR/QBTS/COIN while he is asleep in HKT. His own short exit rule (3 Nov) is "cover into gap downs" — a live, discretionary, 04:00-HKT decision. The long-side 9EMA trail (D5) at least survives being automated; the short exit does not. Rebuild shorts only after one full year of long-only data at 0.35R.

E. WHAT IS STILL MISSING — RANKED BY VALUE PER HOUR

Rank	Missing	Why it is the binding constraint	Cheapest method	Effort
1	**Per-trade P&L: fills, stop prices, R, holding periods.**	Without it, *nothing in the pack is an expectancy model*. We cannot compute win rate, R distribution, average winner/loser, or test the +300.1R claim — which currently **fails to reconcile with the published return by a factor of 2.4×** (Section C). This one dataset closes C's largest open question and converts the rule library into something backtestable.	(a) Email James Muninn for his dataset or at minimum his per-trade R series — he already has it and the question is specific; (b) scrape the **public Kinfo profile** for any trade-level feed behind the aggregate stats (broker-linked = authoritative, outranks every reconstruction); (c) request the USIC monthly broker statements.	**1 email + 2–4h scraping.** By far the best ratio in this list.
2	**Video / screen state at the moment of each entry quote.**	We have 182 entry events with *no price, no stop, no timestamp*. Video gives all three and simultaneously fixes the event→intraday-time mapping, which would let us test same-day stop rate (currently n=41 of 111, 36.9% coverage) and actual position sizes (which B9 suggests diverge from what he says).	The login wall is **server-IP specific**, not account-specific — `yt-dlp --cookies-from-browser` from a residential IP, or a low-cost residential proxy / consumer VPS. Then pull only the 182 entry clips at ±2 min and OCR the order ticket and chart crosshair.	**6–10h engineering.** Then either ~20–40h for all 182 clips, or **sample 40 entries** for a statistical estimate at ~6h. Do the 40-clip sample first.
3	**USIC October and November standings, plus the competition's audit standard.**	The last official print is **+785.8% (30 Sep)** — *below* the claimed range. Until Oct/Nov publish, the headline cannot be stated in the present tense. Separately, the pack does not record whether USIC verifies by broker statement, read-only API, or screenshot — which determines how much weight the entire A-section can bear.	Re-pull the financial-competitions.com monthly standings page after each month-end publication; email the organiser one question: "what is the verification requirement for a posted return?"	**<1h.**
4 (honourable mention)	**Jan/Feb 2026 standings, the 7 missing episodes, and the Dec 2025 baseline.**	The March YTD (+96.3%) equals the March month figure, implying Jan–Feb cumulative ≈ 0% — currently an **inference from a null row**, not a fact. And the Dec 2025 −26% is self-reported on-stream, yet it is load-bearing for reconciliation scenario (c), which produces the tightest starting-equity estimate ($559,508).	Same standings page, earlier months; re-attempt the 7 failed transcriptions.	**1–2h.**

77 closed round trips of 236 reconstructed; a trip counts as closed only when a later stream states the exit or the stop-out.

8 · Appendix B — per-ticker chronology for his six most-traded names

COIN — 35 events

Date	Action	Side/Setup	Close that day	What he said
2026-03-03	**entry**	short/weak_bounce	182.36 (-1.6%)	Let's show the circle on this opening range breakdown. I don't like it. But um just let's try to see whether it works out or not.
2026-03-03	**stop_out**	short/weak_bounce	182.36 (-1.6%)	Oh, heat. No, got stopped out from circle again. So, I think that's the that's it. Nvidia pull back to the daily daily 9 EMA.
2026-03-04	**exit**	long/breakout	208.93 (+14.6%)	Now it's getting up into the hourly 21. I have lowered my stop to break even, so let's see how it how it plays out. I went Q has been um found found h
2026-03-05	**plan_only**	short/unknown	205.71 (-1.5%)	I have a strong feeling that Circle is going to have a huge reversion to the downside. I have a really good risk reward of shorting here.
2026-04-06	**entry**	long/pullback	174.79 (+1.9%)	The it opens at the anchor VWAP from this swing high and on the 21 EMA and on the unfilled gap. So this level is a really really a key level to me and
2026-04-07	**stop_out**	long/unknown	175.18 (+0.2%)	I'm going to possibly got stopped out from I think coin maybe AOI too.
2026-04-07	**plan_only**	long/unknown	175.18 (+0.2%)	So I think I will I'll have a 5% draw down like or today for my whole portfolio if I got stopped out from PMR and coin maybe even higher.
2026-04-09	**stop_out**	long/unknown	169.02 (-3.5%)	I'm going to raise my stop of coin to break even in case it keeps coming down.
2026-04-09	**stop_out**	long/unknown	169.02 (-3.5%)	If coin starts bottoming from here and then rips higher after getting stopped out, I will be I'll be pissed.
2026-04-22	**entry**	long/orb	206.24 (+5.2%)	Entry on corn and B M N O uh I did this on the 1-minute charts. I'm just buying like the 1-minute 1-minute breakouts. It's actually the coin is the st
2026-04-22	**plan_only**	short/parabolic_short	206.24 (+5.2%)	Don't think car is going to tank here. I think it's going to get another rip higher. I think it is going to a thousand or thousand 1,100 1,100.
2026-04-23	**stop_out**	long/pullback	197.93 (-4.0%)	Come on. coin probably going to get stopped out. Yeah, I think it's it's fine. Yeah, I'm just I I think I'm just going to let it to get stopped out ri
2026-04-23	**stop_out**	long/pullback	197.93 (-4.0%)	Am I getting shakeouts from coin again?
2026-04-23	**plan_only**	long/pullback	197.93 (-4.0%)	I am going to buy coin again. Card doesn't worth the wait. This thing is just playing with me.
2026-05-05	**stop_out**	long/unknown	197.75 (-2.6%)	No coin. It just stops me out. So looks like it's not ready yet. earnings in three days.
2026-05-05	**exit**	long/unknown	197.75 (-2.6%)	I think I bought it on this 15-minut breakout or a five minute breakout. Maybe on the five minute breakout. I'm not sure this is correct, but yeah, ei
2026-07-13	**exit**	long/unknown	157.37 (-1.1%)	I closed put on Tuesday. uh I kind of sell it into the strength uh like the close below the 9 EMA on the 16 minute charts
2026-07-22	**entry**	long/breakout	166.12 (-5.5%)	and coin I think is the entry is similar to the BMR maybe a little bit later but like um this is the five minute breakout and breaking out from this r
2026-07-23	**plan_only**	short/weak_bounce	161.16 (-3.0%)	I would definitely also take the item micro strategy coin or this terolf and and we'll see MU is rallying
2026-07-29	**plan_only**	long/weak_bounce	160.09 (-4.7%)	coin earnings tomorrow the A3 Well, I got punished by by the poor entry. should have entered on this bounce but I kind of I kind of expected so I real

2026-08-04	**plan_only**	long/unknown	150.73 (+2.9%)	Circle is super strong today. Tomorrow got earnings tomorrow. Free market.
2026-08-06	**stop_out**	long/unknown	145.41 (-3.0%)	Man, this circle is going it's going straight up after stopping me out at the open. Um, yeah, this is what it is. circle is below all EMAs and you're
2026-08-21	**exit**	long/unknown	186.49 (+8.2%)	even I long like coin I mean somewhere maybe back here or back here and then and uh yeah too early always but that's um lesson learned again
2026-09-21	**plan_only**	long/pullback	201.05 (+3.5%)	For coin I'm plan to take some off at 150 weekly which it has like shown some support and resistance
2026-10-13	**plan_only**	unknown/unknown	181.79 (+0.8%)	Maybe, maybe I'll switch, I'll fit long on the cryptos. Especially like MSTR is looking pretty good. I was afraid to go to the short side because of t
2026-10-20	**entry**	short/unknown	170.85 (+1.4%)	like maybe like the coin and EMNR shorts. Yes. Uh they are like still they're around like 20 to 25%.
2026-10-20	**entry**	short/unknown	170.85 (+1.4%)	I think coin is like around 20% and BN is like 18 or 19% of my account
2026-10-21	**plan_only**	short/unknown	177.08 (+3.6%)	And coin is dropping too fast, I would like to short this one too, but I don't like shorting here.
2026-10-22	**entry**	short/unknown	169.09 (-4.5%)	I'm gonna short on coin is fine. I made the short on SNDK like earlier in the early morning may not be that good as the like the queue is not at the r
2026-10-22	**exit**	short/unknown	169.09 (-4.5%)	I can't short coin anymore. That's fine. Look at this one.
2026-10-23	**entry**	short/pullback	164.45 (-2.7%)	you shorted at 148.8. I think that's a really nice entry. I like it.
2026-10-26	**entry**	short/unknown	159.60 (-3.0%)	And the reason why I choose coin on Friday is definitely a little bit extended from the 9.
2026-11-02	**cover**	short/unknown	137.83 (-4.0%)	Yes, so on Friday I did close my coin shorts at around 140 low 140s on slightly above this swing lows
2026-11-03	**cover**	short/weak_bounce	145.45 (+5.5%)	Yeah, and oil I covered it near the lows of yesterday like at the early nine year May. Not really the best, but I guess it's just like the close below
2026-11-04	**entry**	long/pullback	151.50 (+4.2%)	and getting extended to the downside, trying to break down but failed yesterday which right and yesterday is a good reclaim and to date together with

SNDK — 28 events

Date	Action	Side/Setup	Close that day	What he said
2026-01-07	**plan_only**	long/breakout	353.56 (+1.1%)	So on Friday when I saw this NDK is trying to break out today, I don't I don't have that like determination or the right condition to trade and I hesi
2026-02-11	**entry**	long/unknown	599.34 (+10.7%)	But, uh I entered yesterday, uh SNDK yesterday and gold uh premarket on the short side. So, I'm I'm focusing on the short side for today.
2026-02-11	**plan_only**	long/unknown	599.34 (+10.7%)	Oh, DK probably going to stop me out uh right after market open. I don't see a lot like anything really exciting on the long side at least like for fo
2026-02-11	**entry**	short/unknown	599.34 (+10.7%)	I'm already shorting mu and dk. These two are definitely not the lagging ones.
2026-02-11	**entry**	short/unknown	599.34 (+10.7%)	Not sure but like I'm shorting this 5 minute breakdown. If MU is getting some follow through maybe SNDK is the next one.
2026-02-11	**exit**	short/parabolic_short	599.34 (+10.7%)	I've shorted it on I think last Thursday. Is it last Thursday? Yes, I believe. And then it stops me out. Actually didn't stops me out. I just took it

2026-02-13	**entry**	short/weak_bounce	626.56 (-0.6%)	Shorted a bit here. And I have already tried SMDK for three or four times.
2026-02-18	**entry**	short/breakout	600.40 (+1.7%)	SNDK. Yes. Re-entry yesterday. Oh, I took the 15 minute breakdown. But uh this thing is super strong.
2026-02-23	**stop_out**	long/unknown	666.49 (+2.5%)	And uh it got stopped out of SNTK again. And it's not it's like uh it's not setting up for higher
2026-02-26	**plan_only**	short/parabolic_short	651.90 (+3.1%)	I really really think the SNTK has a has a higher probability of going lower than is then going higher.
2026-02-26	**plan_only**	short/parabolic_short	651.90 (+3.1%)	If SDK is going to bounce back into the 620 22 23 area that will be nice.
2026-03-02	**entry**	short/pullback	619.08 (-2.6%)	And I added the S and T K. For the angle V up retest. Not sure. I think it It works uh if it works a short.
2026-03-12	**cover**	short/weak_bounce		And SNTK, the memory name short, I covered it uh covered them a bit late. After the first close above the hourly 9 EMA. So, around 555 area for SNTK.
2026-07-23	**stop_out**	short/unknown	1610.33 (+0.7%)	But probably I will also got stops from SNDK.
2026-07-24	**stop_out**	short/weak_bounce	1436.56 (-10.8%)	You didn't get stopped out in SNDK. Uh yes, I I did get stopped out, but I re-enter it uh at the 21 EMA daily 60-minut 150 EMA 15 minutes breakdown.
2026-07-24	**entry**	short/breakout	1436.56 (-10.8%)	but I re-enter it uh at the 21 EMA daily 60-minut 150 EMA 15 minutes breakdown.
2026-07-28	**cover**	short/unknown	1096.10 (-14.2%)	SNDK falls below the 1100 marks. So I just kind of like it. I like the numbers 1100 that I just that's that's why I covered it into into the level.
2026-08-21	**plan_only**	long/breakout	1596.08 (-0.3%)	SNDK is looking pretty good but it's it's tight here and above the the nine and all the EMAs but it's it's been a while that is like Looks like gettin
2026-08-28	**add**	short/unknown	1484.98 (+0.0%)	I built a slightly bigger positions on SNTK and SKH Highix. I think I don't I won't I got no buying power left and Yeah, let's see how it goes.
2026-08-31	**entry**	short/unknown	1566.70 (+5.5%)	Let's see whether I will get stopped out on SNDK or um SK Highix.
2026-09-02	**plan_only**	short/weak_bounce	1553.40 (+1.1%)	So the stop will be around 1%.
2026-09-03	**plan_only**	short/unknown	1554.99 (+0.1%)	I think this is a kind of a great wrench contraction and probably there will be an expansion coming in. The reason why I'm showing a sentence is not I
2026-09-21	**entry**	long/breakout		On Friday, at the first two trades, like on SNTK, both SNTK and hood, it's kind of working well
2026-10-12	**entry**	short/pullback	1487.33 (-6.0%)	the ones that it really stands out is SNDK. So SNDK actually entered this on 18th of September. And then I eventually closed it, I think, on this day.
2026-10-12	**add**	short/pullback	1487.33 (-6.0%)	And then that even added it into on this bounce, on the Wednesday bounce, Wednesday rally. And Yeah, it's a little bit aggressive. I don't really reco
2026-10-20	**add**	long/unknown	1365.38 (-0.4%)	the biggest winner is like the SNDQ because I'm like um I add I add into it and um it's one of the like the it it's a larger position than than a norm
2026-10-22	**entry**	short/unknown	1260.93 (-8.5%)	I made the short on SNDK like earlier in the early morning may not be that good as the like the queue is not at the resistance level so it like it mak
2026-10-23	**stop_out**	short/pullback	1238.03 (-1.8%)	and then SNDK is going for the the 50 on the hourly. I think I would still try to short it, but I don't know like is sometimes it depends. And also if

MSTR — 26 events

Date	Action	Side/Setup	Close that day	What he said
2026-01-07	**plan_only**	long/pullback	161.83 (+2.4%)	If it can do one or two more days above the 9 EMA and also like the daily EMAs can be uh the 50 can be a little bit closer to the 150. then I I'll con
2026-03-02	**stop_out**	short/unknown	137.65 (+6.3%)	I got I got stopped though for MSTR shorts. That's the push right after the market. All right at the market open. Stop all circle. Cuz I think it take
2026-04-07	**stop_out**	long/unknown	123.72 (-3.1%)	All right. So, I got stopped out from Micro Strategy 2.
2026-04-07	**plan_only**	long/unknown	123.72 (-3.1%)	So I think I will I'll have a 5% draw down like or today for my whole portfolio if I got stopped out from PMR and coin maybe even higher.
2026-04-09	**plan_only**	long/breakout	128.86 (+0.4%)	Like if crypto can regain the strength like it break out from this tiny flag on on a four hour time frame. Maybe I will consider entering MicroStrateg
2026-04-09	**entry**	long/breakout	128.86 (+0.4%)	I kind of like this MSTR candle under cutting weekly on the 9 EMA. I don't like buying this 5-minute candle breakout. But, I think I'm going to take a
2026-04-14	**plan_only**	long/unknown	137.41 (+3.8%)	Like I have a like a mental stop at around like uh below this gap. So, it's this around 120 high 123s. So, if MicroStrategy is dipped below 123 high 1
2026-04-15	**unknown**	long/unknown	143.54 (+4.5%)	MSTR also raising the stop below this gap. Galaxy is a bit stronger than uh uh let's see let's see whether it can hold up or
2026-04-27	**trim**	long/unknown	169.20 (-1.1%)	And I think maybe it's a good time to pew some profits off. Pew some 7% above the 50 EMA.
2026-05-05	**entry**	long/breakout	186.90 (+1.7%)	So I bought the and and after the like the first 60-minut candle, MSTL close above the 9 on the 60-minut chart. I think could could be the the start o
2026-05-08	**exit**	long/unknown	187.59 (+4.3%)	Why selling MSTR? I sold it uh yesterday with circle because I kind of I saw kind of a rejection at the like Bitcoin is 21 EMA on the weekly.
2026-07-22	**entry**	long/orb	100.01 (-1.9%)	so at the open I I think I bought the MSTR probably opening range highs and almost stopped knocked me out intraday but but it didn't also bought BMR.
2026-07-23	**plan_only**	short/unknown	93.63 (-6.4%)	I would definitely also take the item micro strategy coin or this terolf and and we'll see MU is rallying
2026-07-27	**plan_only**	short/weak_bounce	98.65 (+7.6%)	I'm going to consider consider shorting this micro strategy today. But I don't know, we'll see.
2026-07-27	**entry**	short/weak_bounce	98.65 (+7.6%)	Why did you decide to take your second trade of um MSTR when you did it had a little bit of gap to the declining 21 EMA.
2026-07-27	**plan_only**	short/weak_bounce	98.65 (+7.6%)	How about flipping a coin? Like you decide. The heads uh the head is is is is hold, the tail is short, and then you let the coin decide.
2026-07-28	**stop_out**	short/unknown	96.16 (-2.5%)	They're very unfortunate that I got stopped out on MSTR yesterday, but I mean yesterday did not giving us a really good risk reward entry with a tight
2026-07-28	**stop_out**	short/unknown	96.16 (-2.5%)	It looks like I'm going to get stopped out on MSTR. So, I think I'm going to close my short on DS as well.
2026-07-28	**trim**	short/unknown	96.16 (-2.5%)	I think I'm going to lower my stop uh this into this gap uh the high of this gap today's gap down. So it's easier to manage uh this position this posi
2026-08-12	**exit**	long/unknown	94.83 (-1.3%)	Yeah, I sold uh MSTR and uh BMR yesterday because as I've said they I'm using the nine I'm using the nine uh as the as the guide
2026-08-21	**stop_out**	long/unknown	119.25 (+6.1%)	and MSTR I got stopped out because it was yeah pretty weak like BMR I kind of exited like early
2026-09-17	**plan_only**	long/unknown	132.25 (+4.8%)	even with a very tight stop, like even for MSTR my stop is around like 0.75% percent, but I'm still using a 20, 22, 23% sizing on this one.
2026-09-21	**entry**	long/pullback	168.50 (+9.5%)	So I think it could be an entry with a really tight risk like if it fouls this three EMAs.

2026-09-21	**stop_out**	long/pullback	168.50 (+9.5%)	Maybe on this candle or maybe this candle and then the stop setting the low, the low of this candle.
2026-09-21	**entry**	long/pullback	168.50 (+9.5%)	I will enter it the same size. It's still like around I think 22 or 23%.
2026-10-23	**plan_only**	short/pullback	146.01 (+0.1%)	MSTR is also the another one that I would like to short, but I think yeah, I think that will be too too heavily shorted.

QBTS — 17 events

Date	Action	Side/Setup	Close that day	What he said
2026-01-07	**entry**	long/breakout	30.20 (-3.4%)	And for QBTS, um this is not a standard entry. I think this this trade um I'm not doing it. Yeah, it's not a really good setup or a really good entry.
2026-01-07	**stop_out**	short/weak_bounce	30.20 (-3.4%)	The QBTS I also shorted at the 17th of December and then I got stopped out on on Friday. Also, I think this trade is um I I consider this is an is an
2026-01-09	**entry**	long/orb	28.11 (-4.0%)	So for hearts I enter on this day and for QBTS and I enter on this day. Yeah, I missed this. This is a better entry for in my opinion this day here. B
2026-02-27	**cover**	short/unknown	18.78 (-6.8%)	I just covered some QBTS on the on the dip on this candle.
2026-03-03	**cover**	short/weak_bounce	18.24 (-3.7%)	QBTS and OQ not not yet not yet. I already covered some QBTS.
2026-05-05	**entry**	long/breakout	21.54 (+3.0%)	I just bought the breakouts like this the breakout of the previous day high and Oliver Calcis wick play when it opens um at the upper wick of the prev
2026-05-12	**plan_only**	long/orb	22.35 (-7.0%)	I actually would like to buy this one minute breakout on QBT, but I Yeah, it's still it's also a five minute breakout, but I run out of buying power a
2026-05-21	**entry**	long/orb	25.74 (+33.4%)	I submitted a market order, but My QBTS order is uh is not getting filled. I don't know what's happening. I bought it at the first minute.
2026-05-22	**trim**	long/unknown	29.40 (+14.2%)	I've sold 15% QBTS into strength.
2026-06-04	**exit**	long/unknown	27.64 (+0.3%)	I'm not going to panic sell um all of my position at once. Going to I'm feeling I'm going to uh um Yeah, get rid of QBTS.
2026-06-04	**exit**	long/unknown	27.64 (+0.3%)	But I'm just I just sold my QBTS. That this reversal from Apple yesterday makes the weekly really bearish.
2026-06-12	**plan_only**	long/breakout	23.37 (-1.9%)	Yeah, I think like um this 15-minut candle is a good entry. Actually, I I I would consider that if you really would like to get in uh to buy in Q afte
2026-07-01	**entry**	long/pullback	23.50 (-2.0%)	I only make one trade yesterday. It's the QBTS. I kind of like the Quantums bouncing off the the weekly EMAs and trying to stay above the nine.
2026-07-02	**entry**	short/weak_bounce	22.53 (-4.1%)	I am shorting QBTS after getting stopped out yesterday.
2026-07-02	**stop_out**	long/unknown	22.53 (-4.1%)	I am shorting QBTS after getting stopped out yesterday.
2026-10-12	**entry**	short/unknown	13.74 (-5.7%)	I actually shorted like QBTS on Friday here. I think yeah, I'm fighting here.
2026-10-12	**cover**	short/unknown	13.74 (-5.7%)	But then I like somehow I on this Tuesday I somehow covered it, covered it into strength. I just got I don't know like panic or what.

INTC — 20 events

Date	Action	Side/Setup	Close that day	What he said

2026-02-13	**plan_only**	short/unknown	46.79 (+0.7%)	I can even short maybe Intel here, but but it's still in an uptrend.
2026-04-14	**plan_only**	long/unknown	63.81 (-2.1%)	Uh Intel is another stock that I want to get in. Love to to closely monitor. And Nokia is also really strong. And also getting moving faster and faste
2026-04-23	**plan_only**	long/pullback	66.78 (+2.3%)	would like to see a gap down. Actually, if a Intel is get getting a gap down after earnings, there will be a possible pullback buy maybe at the 21.
2026-04-27	**stop_out**	long/unknown	84.99 (+3.0%)	If I tried to entry Intel EP last Friday yeah. I was not trading uh in my desk, but I tried to trade it on my phone and then I think I tried I tried i
2026-04-29	**stop_out**	long/unknown	94.75 (+12.1%)	Intel is pushing higher and I unfortunately I got stopped out uh yesterday.
2026-05-05	**stop_out**	short/unknown	108.15 (+12.9%)	Intel skip it. Uh, I got stuff that was on Intel on on Tuesday and then it just 30% since. So, a great lesson is uh, you know, wait for the the pullba
2026-05-05	**cover**	short/unknown	108.15 (+12.9%)	Should have should be a a little bit more patient. I think a great lesson learned.
2026-05-21	**plan_only**	long/pullback	118.50 (-0.4%)	Intel. Intel is um building a flag above the9. They're building a base. Maybe not a flag. after a 200% move in just a month and a half, less than a mo
2026-05-21	**plan_only**	long/pullback	118.50 (-0.4%)	something like Intel here like after this huge green candle like every low of day is higher than the previous day until here.
2026-05-26	**entry**	long/breakout	123.52 (+3.1%)	Can I explain my re-entry on Intel? Um, yeah, I missed the pullback on the on the 9 EMA and the angel fee web. And yeah, I I just bought the weekly br
2026-05-28	**entry**	long/pullback	120.89 (-0.7%)	Sounds a little bit silly, but I'm going to reby my intel. If it's starting to find support right here, right now
2026-06-02	**plan_only**	long/pullback	107.93 (-1.3%)	For example, Intel, it is pulling back into the angle V on the daily uh weekly too. So we love like to see are there like we will get a bounce from he
2026-06-12	**entry**	long/pullback	124.57 (+6.5%)	I bought uh boot and intel on the on this on the same 60-minute candle when the when the Q's and other indices starting to bounce
2026-06-22	**entry**	long/unknown	140.94 (+5.2%)	And also Intel. Intel is I really like my my entry on uh on this thing right here.
2026-07-02	**exit**	long/unknown	120.35 (-5.2%)	And what are the other names like Intel uh and also corning like the major reason is actually corning.
2026-07-15	**entry**	long/pullback	102.99 (-4.4%)	You're saying anything wrong I got intel on uh 13 of July. I don't think it's wrong. It's definitely not wrong.
2026-08-12	**plan_only**	long/unknown	100.95 (+3.3%)	although I'm I'm pretty bullish on Intel but I would also like to to track the the price actions when Intel reaches the 50 the declining 50 like how h
2026-08-13	**plan_only**	long/unknown	104.56 (+3.6%)	Yesterday you said you were only looking at Intel because it had overhead resistance. Looks like today Rocket Lab has the same and you consider it a g
2026-08-31	**entry**	short/pullback	89.51 (+0.0%)	And Intel is doing similar thing like rejected at the 9 also this the end of VW from the swing high but I think yeah I've got pretty huge exposure on
2026-09-17	**plan_only**	long/pullback	108.80 (+7.7%)	The Intel is looking strong, AMD is also looking strong, but I'm just not gonna buy into the strength.

CRWD — 15 events

Date	Action	Side/Setup	Close that day	What he said
2026-03-03	**trim**	short/unknown	97.86 (+1.7%)	First offer some core width but just 25%.
2026-05-21	**plan_only**	long/pullback	162.06 (-0.3%)	Third one is the pull pull back into the 9 EMA as well as the like the previous probably level around and the previous highs to like this 457 level.

2026-05-21	**plan_only**	long/pullback	162.06 (-0.3%)	Set the stop at the low of day. That crowd never violates the previous low of day. Like every low of day is higher than the previous day.
2026-06-22	**entry**	long/unknown	168.86 (-1.4%)	Last week I actually took a two new trades on Thursday, the last day of the week, which is Crowd and Corning.
2026-06-23	**stop_out**	long/unknown	170.23 (+0.8%)	I'm not going to do to reduce my exposure unless I got stopped out maybe like crowd.
2026-07-13	**exit**	long/unknown	187.91 (+0.4%)	crowd uh foret and and net I I sold them all on the on Friday like clo uh after crowd closed below the 9 EMA
2026-07-22	**stop_out**	long/unknown	188.42 (-1.4%)	Uh I have like uh I tried some cyber security stocks on Thursday but I got stopped out yesterday but I re-entered like I reentered on on net and uh th
2026-08-03	**entry**	long/pullback	202.54 (+6.1%)	So, Crowd um Yeah, I I entered this on on stream. Um And this this um hasn't shake me out.
2026-08-04	**plan_only**	long/unknown	211.22 (+4.3%)	for example if I'm if I'm entering crowd like for um let's let's say crowd on this trade I'll probably trim trim some today if uh when if I'm trading
2026-08-04	**plan_only**	long/unknown	211.22 (+4.3%)	Oh, crowd. Would you trim some after it crossed the trend line? I have no plans on trimming any positions.
2026-09-21	**plan_only**	long/pullback	249.35 (+4.9%)	some bounds on the rising 9 or even the rising 21 today and also catch a bounce on this crowd together with the IGV
2026-10-20	**stop_out**	long/pullback	227.37 (-0.3%)	Let's say you were long CRM yesterday or 10 uh SMA bounce would you have stopped at open or would you watch one minute and it just stop
2026-10-21	**plan_only**	short/pullback	239.34 (+5.3%)	Shortest snow on the 5 minute breakdown, snow, yeah I kind of like it, although snow is not, like I said, it's one of the strongest software names
2026-11-04	**plan_only**	long/pullback	241.00 (-1.5%)	So and today we got the 50 year May supports. The weekly nine year May supports.
2026-11-04	**exit**	long/parabolic_short	241.00 (-1.5%)	Crowd looks barriced. I'm selling crowd right now. It's heading into the resistance level.
